 - **Simulation:** Variable n_D, n_S
 - **Simulation:** Service Duration Distribution Function
 - **Simulation:** Wait Duration Distribution Function
-

Queue Simulation

We aim to perform the simulation
under this constraint:

$$\frac{\lambda_D}{\lambda_S} = \frac{1}{2}$$

$S \stackrel{\Delta}{=} \text{Sum of Exponential Random Variables for Service Time}$

$D \stackrel{\Delta}{=} \text{Sum of Exponential Random Variables for Inter-arrival Delay}$

Queue Simulation

Let,

$$S \stackrel{\Delta}{=} \sum_{k=1}^{n_S} S_k, \quad D \stackrel{\Delta}{=} \sum_{k=1}^{n_D} D_k$$

with,

$$S_k \sim f_{S_k}(x) = \lambda_{S_k} e^{-\lambda_{S_k} x} \cdot u(x)$$

$$D_k \sim f_{D_k}(x) = \lambda_{D_k} e^{-\lambda_{D_k} x} \cdot u(x)$$

where,

$$\lambda_{S_k}^{-1} = \frac{\lambda_S^{-1}}{n_S}, \quad \lambda_{D_k}^{-1} = \frac{\lambda_D^{-1}}{n_D}$$

$$S \sim * f_{S_k}(x) = \frac{\lambda_{S_k}^{n_S}}{(n_S - 1)!} \cdot x^{(n_S - 1)} e^{-\lambda_{S_k} x} \cdot u(x)$$

$$D \sim * f_{D_k}(x) = \frac{\lambda_{D_k}^{n_D}}{(n_D - 1)!} \cdot x^{(n_D - 1)} e^{-\lambda_{D_k} x} \cdot u(x)$$

SIMULATION RESULTS

Section 1: Variable n_D

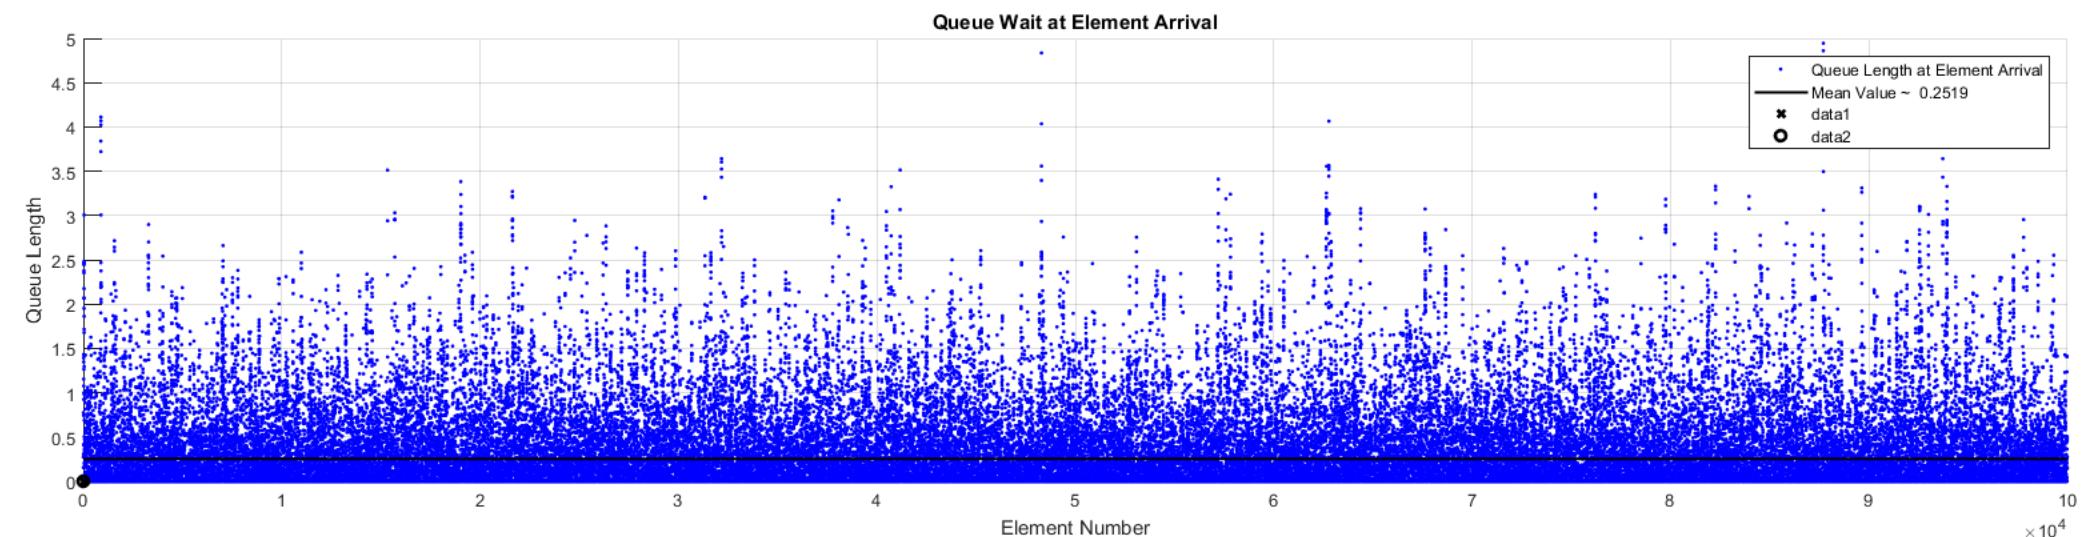

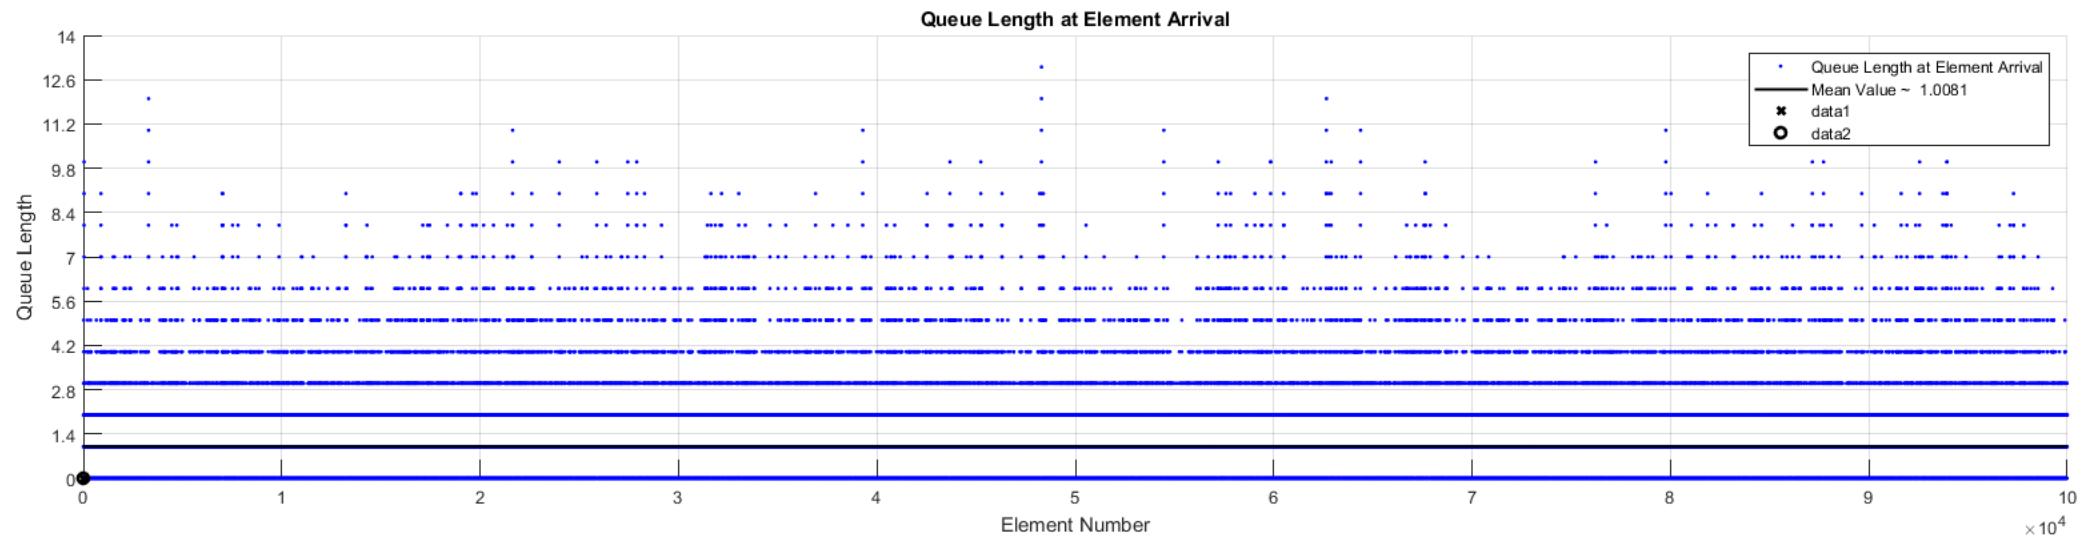

Section 1: Variable n_D

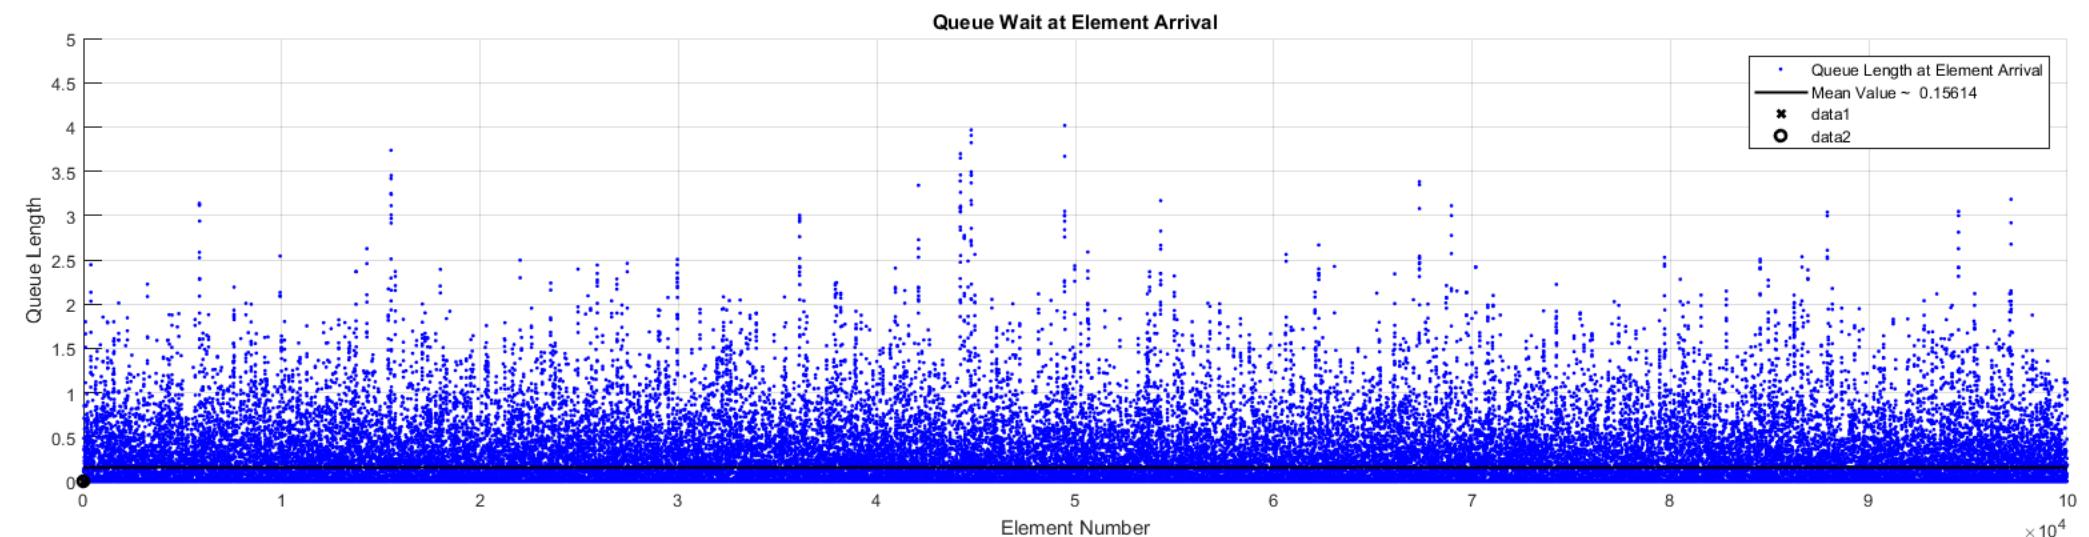

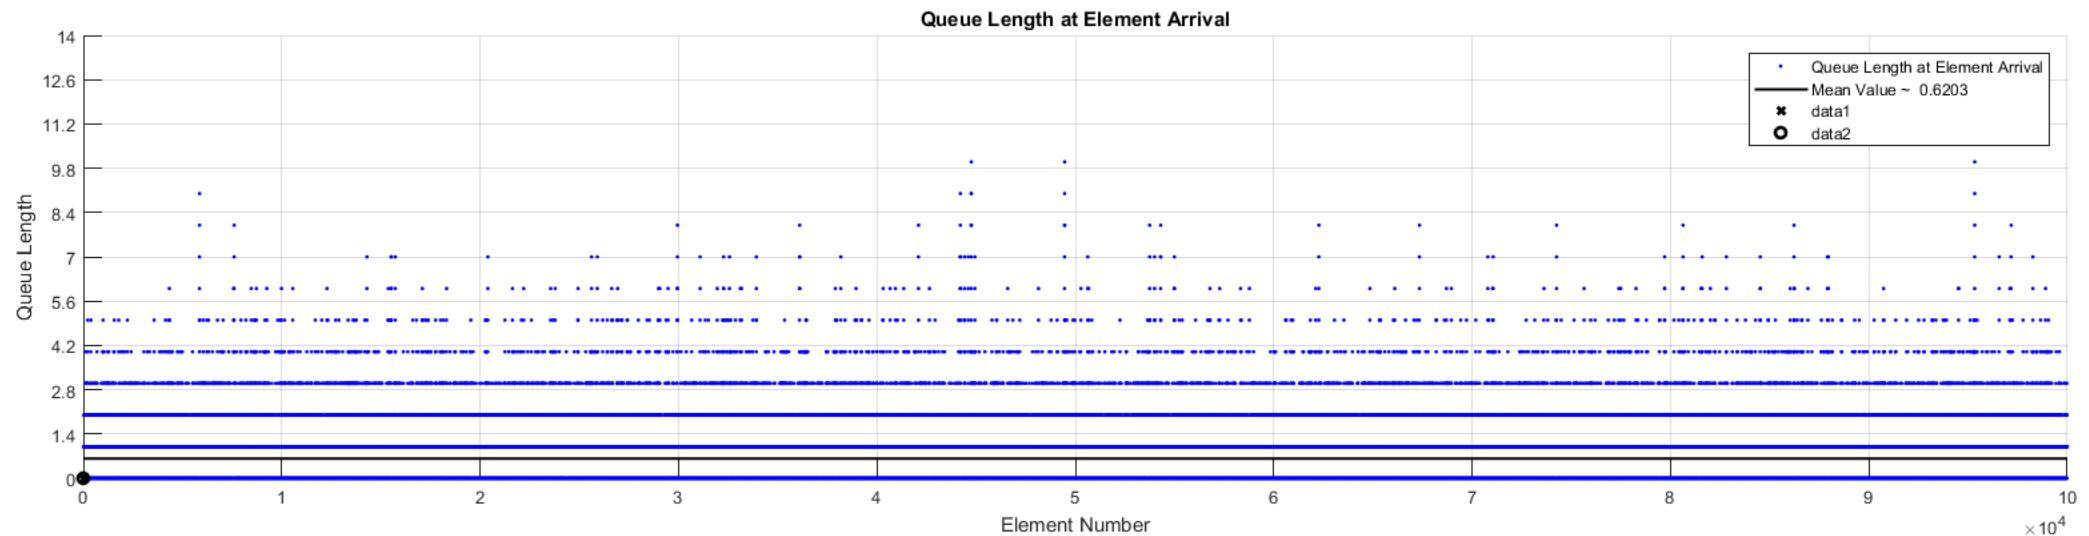

We iterate through a range of n values with $\lambda_D^{-1} = 0.5$, $\lambda_S^{-1} = 0.25$:

n_D	Number of Points	Mean Queue Length	Mean Queue Wait Time
2^0	100,000	1.0081	0.2519
2^1	100,000	0.6203	0.15614
2^2	100,000	0.43436	0.10816
2^3	100,000	0.34816	0.088109
2^4	100,000	0.30009	0.074664
2^5	100,000	0.27533	0.068502
2^6	100,000	0.27046	0.067925
2^7	100,000	0.25605	0.063816
2^8	100,000	0.25729	0.063594
2^9	100,000	0.2577	0.064077
